

2] Explain the difference between DBMS and RDBMS.

Difference between DBMS and RDBMS

1. Definition:

DBMS is a software system for managing and organizing data.

RDBMS is a type of DBMS that stores data in tables with rows and columns.

2. Data Structure:

DBMS stores data as files or key-value pairs without strict structure.

RDBMS stores data in tabular format with well-defined relationships.

3. Relationships:

DBMS does not support relationships between data.

RDBMS enforces relationships using primary and foreign keys.

4. Normalization:

DBMS does not support normalization.

RDBMS supports normalization to reduce redundancy.

5. Integrity:

DBMS lacks strict integrity constraints.

RDBMS ensures data integrity with constraints.
