

4] What are the key features of SQL?

Ans:

Key Features of SQL

1. Data Querying:

SQL allows users to retrieve specific data from databases using commands like select.

2. Data Manipulation:

SQL supports inserting, updating, and deleting data using insert, update, and delete.

3. Data Definition:

SQL defines the structure of databases, tables, and indexes using commands like create, alter, and drop.

4. Data Control:

SQL manages user permissions and data access with commands like grant and revoke.

5. Data Integrity:

SQL enforces constraints like primary keys, foreign keys, and unique constraints to maintain data consistency.

6. Transactions:

SQL supports transaction control with commands like commit, rollback, and savepoint to ensure data reliability.

7. Standardization:

SQL is a standardized language, making it compatible with most relational database systems like MySQL, PostgreSQL, and Oracle.

8. Support for Views:

SQL allows the creation of views for simplifying complex queries and improving security.

9. Join Operations:

SQL supports joining multiple tables to retrieve related data efficiently.

10. Portability:

SQL can be used across different database systems with minimal changes to the code.
