

2] Explain the difference between GROUP BY and ORDER BY.

Ans:

Summary of GROUP BY vs ORDER BY

1. GROUP BY:

Groups rows with the same values into summary rows.

Used with aggregate functions like SUM, COUNT, etc.

Produces one result per group.

Example: GROUP BY category groups data by category.

2. ORDER BY:

Sorts rows in ascending (ASC) or descending (DESC) order.

Does not group rows; simply arranges them.

Example:

ORDER BY quantity DESC sorts rows by quantity in descending order.
