

1] What is a view in SQL, and how is it different from a table?

Ans:

View in SQL:

A view in SQL is a virtual table that consists of a stored query that selects data from one or more tables. It doesn't store data physically but provides a way to represent complex queries as if they were a table. A view simplifies querying by abstracting the complexity of the underlying data structure.

View:

```
CREATE VIEW EmployeeDetails AS  
SELECT employee_name, department_id  
FROM employees  
WHERE salary > 50000;
```
