

3] What is the role of NOT NULL and UNIQUE constraints?

Ans:

1. NOT NULL Constraint:

Ensures that a column cannot have a NULL value.

It is used to enforce the presence of a value in a specific column for every row in a table.

Example:

```
CREATE TABLE students (  
    student_id INT NOT NULL,  
    student_name VARCHAR(100) NOT NULL  
);
```

2. UNIQUE Constraint:

Ensures that all values in a column (or a combination of columns) are distinct.

It allows NULL values unless explicitly combined with the NOT NULL constraint.

Example:

```
CREATE TABLE students (  
    email VARCHAR(100) UNIQUE  
);
```
