

1] Define the SQL Data Definition Language (DDL)

Ans:

SQL Data Definition Language (DDL)

Definition:

DDL (Data Definition Language) is a subset of SQL used to define, modify, and manage the structure of database objects such as tables, indexes, views, and schemas. DDL commands do not manipulate data; instead, they define the schema and structure of the database.

Key DDL Commands:

1. **CREATE:** Used to create new database objects (e.g., tables, views, indexes).

Example:

```
CREATE TABLE students (  
    student_id INT PRIMARY KEY,  
    student_name VARCHAR (100)  
);
```

2. ALTER: Used to modify the structure of existing database objects.

Example:

```
ALTER TABLE students ADD COLUMN age INT;
```

3. DROP: Used to delete database objects like tables or views permanently.

Example:

```
DROP TABLE students;
```

4. TRUNCATE: Used to remove all rows from a table, but it does not delete the table structure.

Example:

```
TRUNCATE TABLE students;
```
